

SK Finance × Ensuredit Embed

Loan-linked insurance: quote on loan approval, in-app insurer selection with Good Health Declaration & OTP, a hold pattern until disbursement, then disbursement-triggered policy issuance and customer delivery.

Three decisions that shape the journey

OPEN • DECISION NEEDED

Q1 • When do we call the Quote API?

- **Option A — At loan approval stage** (current working assumption): quotes generated once the loan is approved.
- **Option B — Earlier, during the agent's pitch:** so the agent can **disclose the insurance cost up front** as part of the loan conversation.
- Decides **where Step 1 sits** in the journey.

CONFIRMED

Q2 • What triggers policy issuance?

- Issuance fires **the moment loan disbursement is triggered** — never before.
- Insurer selection, Good Health Declaration and OTP are captured **earlier** and held by Ensuredit.
- At disbursement, issuance proceeds instantly.

OPEN • OUT OF SCOPE FOR V1

Q3 • How are partial / multiple disbursements handled?

- If a loan is disbursed in tranches (e.g. ₹10L approved, ₹2.5L first), do we issue **one policy for the full sum**, or **one policy per tranche** (child chain under the same Loan ID)?
- **Excluded from the v1 workflow** below — to be confirmed before scoping.

Why it matters: Q1 affects regulatory cost disclosure; Q2 is locked and drives the hold-pattern design; Q3 determines whether the workflow needs a repeatable child-policy chain.

Four phases, end-to-end

- **1 • Quote** — At the Loan Approved stage*, the **LMS/LOS** sends the full dataset to Ensuredit. Ensuredit calls insurer APIs and returns collated quotes, which are surfaced in the **agent app**. *timing subject to Q1
- **2 • Select & Verify** — In the **app** the customer chooses an insurer and completes the **Good Health Declaration** and **OTP verification**; the LMS/LOS pushes this to Ensuredit.
- **3 • Hold** — Ensuredit marks the insurer, stores the Good Health data + OTP confirmation, and places the case in a **hold pattern** awaiting disbursement.
- **4 • Issue & Deliver** — When disbursement is triggered, the **LMS/LOS** calls for issuance; Ensuredit issues the policy and returns it. The **app** stores it to the customer account / Loan ID and notifies the customer via **email + SMS**.

Core principle: Policy issuance is triggered **only on loan disbursement** — selection & verification happen earlier and are held.

Ideal-state flow — 4 lanes, 16 steps

Status transitions inside Ensuredit Embed

Note: The **On Hold** state is where selection, Good Health Declaration and OTP are stored. No insurer issuance API is called until disbursement triggers it. *(Partial / multiple disbursements — see Q3 — are out of scope for v1.)*
